

SECURE NETWORK ARCHITECTURE

Aim:-

To Study and analyze a secure network architecture for protecting network resources

Algorithm:-

1. Identify network components and devices
2. Design network segments. (LAN, DMZ, WAN)
3. Implement firewalls and security controls
4. Apply access control and authentication
5. Monitor network traffic & logs
6. Ensure data protection using encryption

Questions:-

1. How many trunks are present in this configuration?

4

2. What is the VLAN tag ID for interface eth12?

30

3. From the above table, what zone would a user connecting to public web server be in?

External

4. From the above table, what zone would a core domain controller be placed in?

Restricted

5. From the above table, what zone would a user connecting public server be in

DMZ

6. According to the corresponding ACL policy, will the second packet result in a drop, or accept

drop

7. According to the corresponding ACL policy, will the first packet result in a drop or accept

accept

8. What is the flag found after filling in all blanks on the static site?

THM{Mostly_53wre3}

9. What platform processes data sent from SSL proxy?

Unified Threat Management

10. Where does DHCP snooping store leased IP addresses from untrusted hosts?

DHCP Binding

11. Will a switch drop or accept a DHCP RELEASE packet

Drop

12. Does dynamic ARP inspection use the DHCP binding database?

Yes

RESULT:-

The experiment has been successfully completed & verified.
